

# User Preset

To remove user presets in Anycubic Slicer Next, you need to locate the configuration files and delete the specific preset files. First, find the configuration folder by going to Help > Open Configuration Folder. Then, navigate to the "user" folder and then to your specific profile folder (e.g., a folder with a number). Inside, you'll find folders for filament, machine, and process. Locate and delete the JSON files corresponding to the preset you want to remove.
